

# PULL:

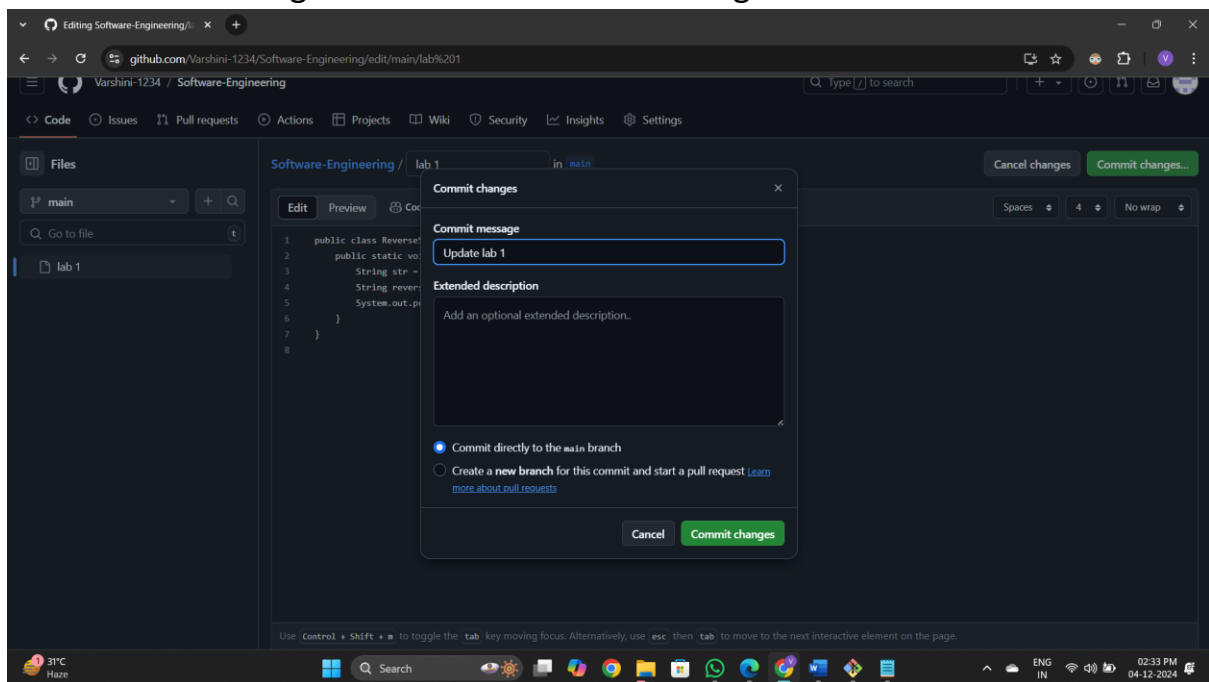

## 1.Open the github account

## 2.Open the file

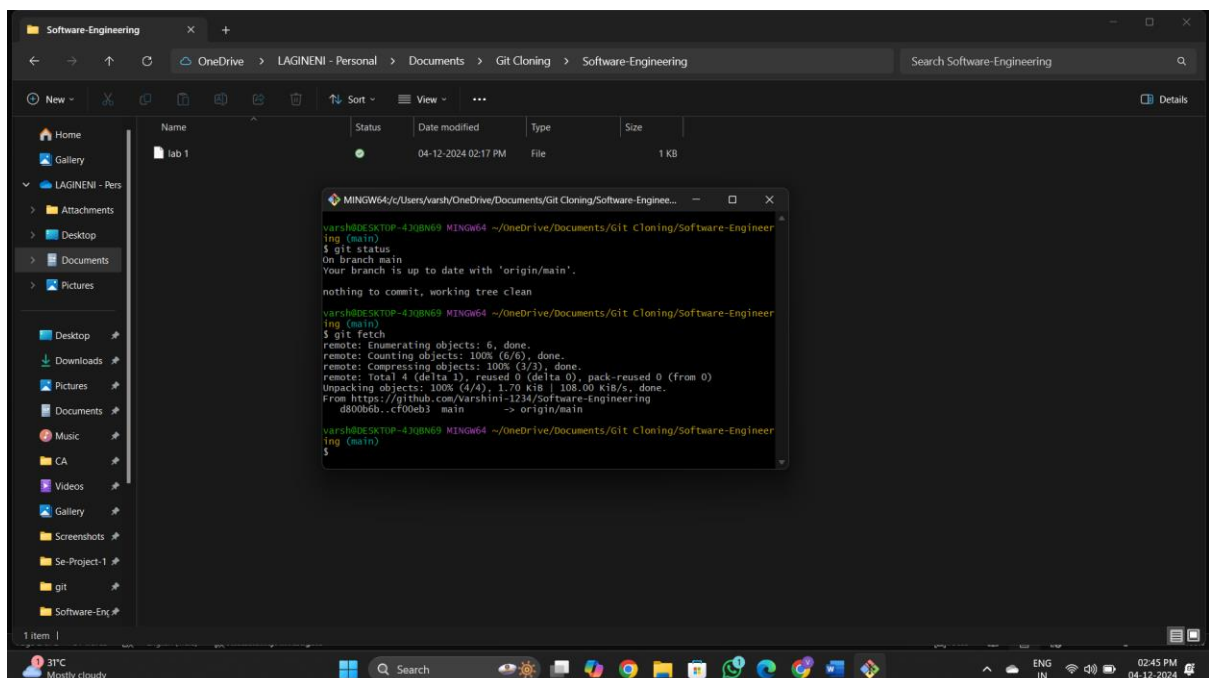

3. make some changes and click on commit changes:

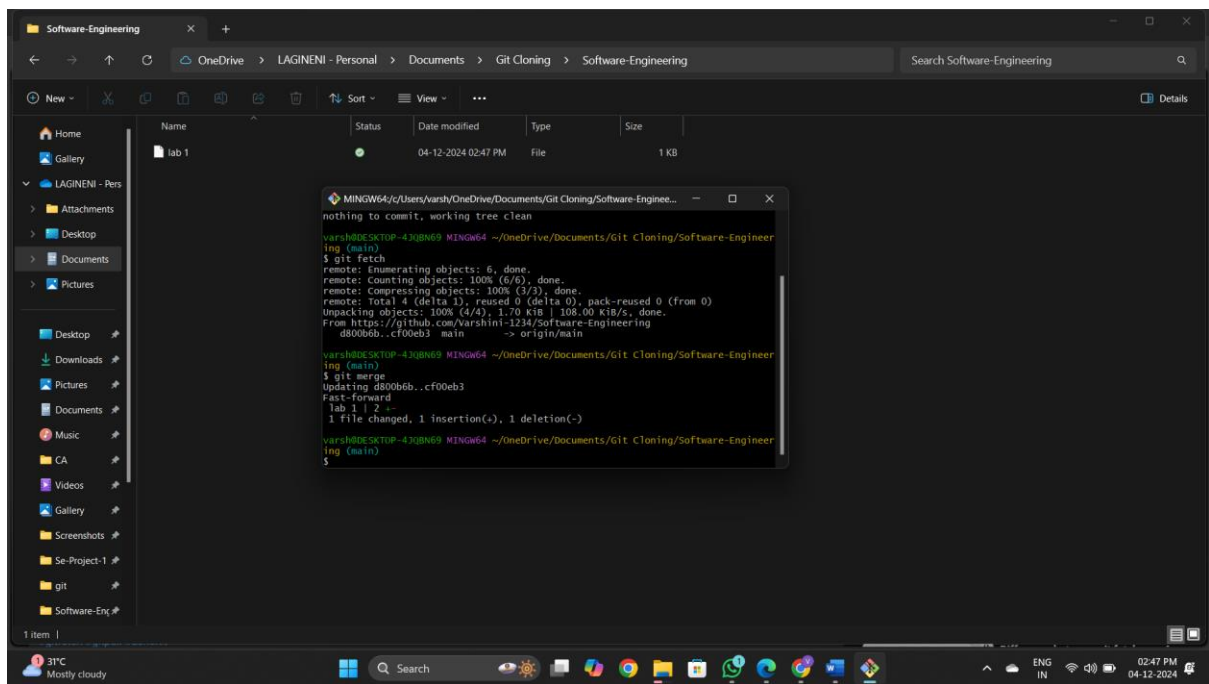

4. Now open full folder and open git bash

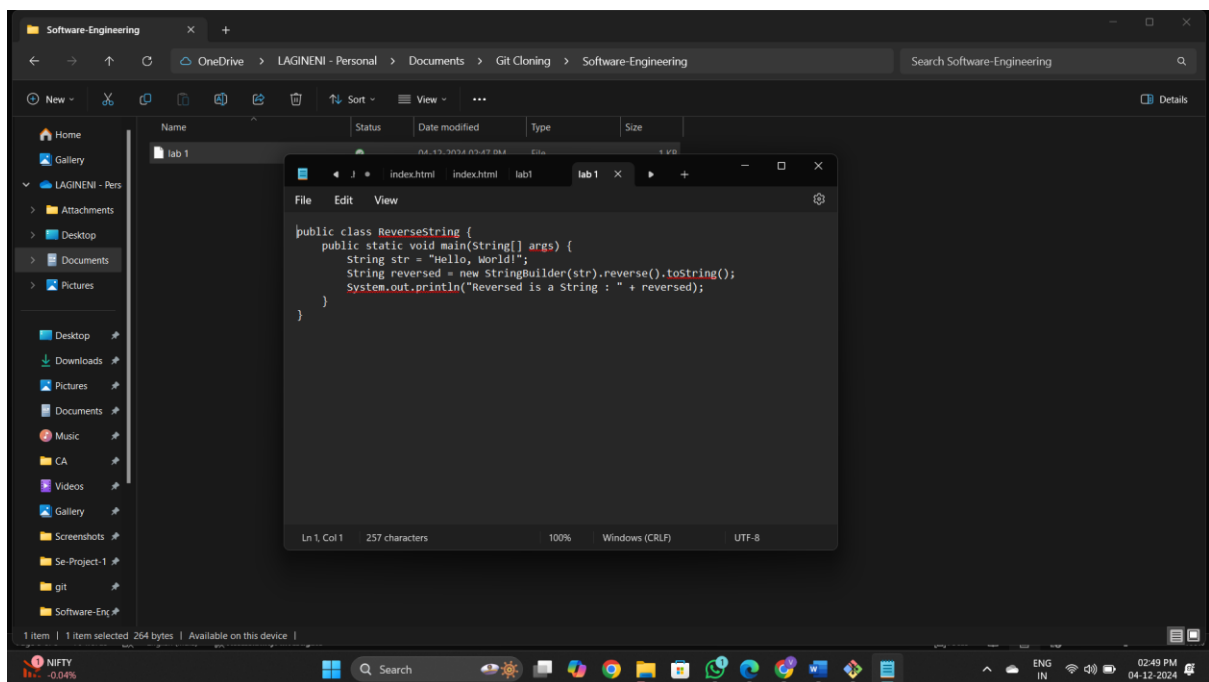

In that give “git status” command . It shows nothing to commit which means it does not show the committed change and give “git fetch” comment

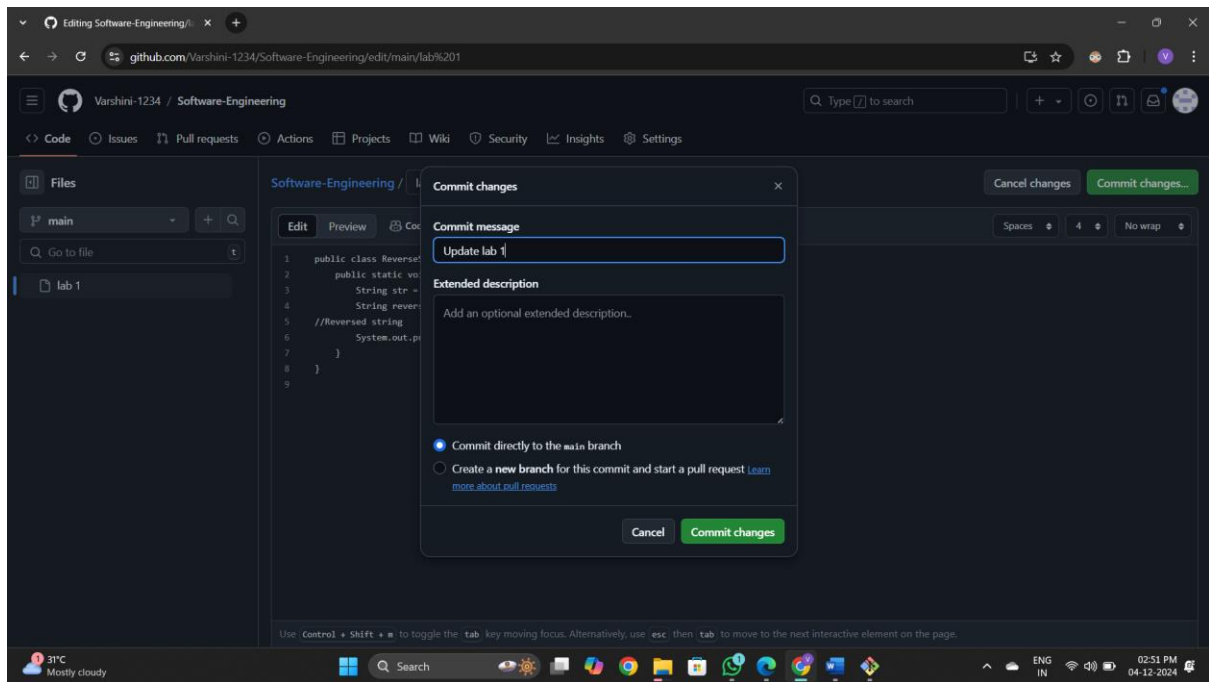

5. Give “git merge” command, so that you can see the changes that are made previously in github account.

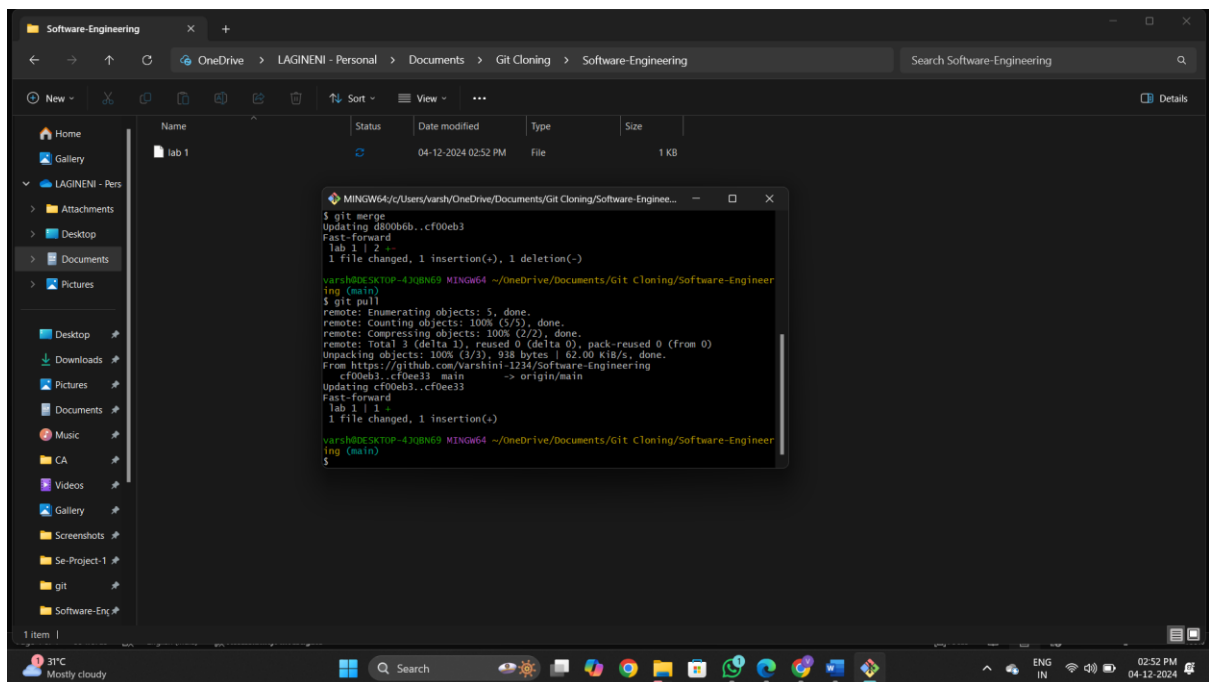

Here is the updated code

Now I added a comment in my code and I gave commit changes

Now give “git pull” command

Direct changes you can see here, no need to give “git merge” command here
